

Tasks for 04/02/2019:

Gauss-Seidel method: Consider the set of algebraic linear equations,

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

.

.

.

$$a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n = b_n$$

Where the coefficients and constants are given by

$$A = \begin{bmatrix} -6 & 2 & 1 & 2 & 1 \\ 3 & 8 & -4 & 1 & 0 \\ -1 & 1 & 4 & 10 & 1 \\ 3 & -4 & 1 & 9 & 2 \\ 2 & 0 & 1 & 3 & 10 \end{bmatrix}$$

And the coefficient matrix is given by $b = [3; 4; -2; 12; 1]$.

- a) Write a code to see if the matrix A is diagonally dominant.
- b) Write a code for solving this equation using Gauss-Seidel method in which the convergence is achieved if error limit in successive iteration is within 0.001.

Linear interpolation: Write a code for two point segment linear interpolation for the dataset given in file points.txt (attached)

Polynomial interpolation 1: Given the three data points $(x, y) = (1.0, 8.0), (2.1, 20.6)$ and $(5.0, 13.7)$, write a program to return the value of y for any arbitrary x in the range $[1.0, 5.0]$ using **second order polynomial**. Use Lagrange method of interpolation to construct the polynomial. **Plot the polynomial** along with the data points.
